Use of lipid-lowering medicinal herbs during pregnancy: A systematic review on safety and dosage

Hojjat Rouhi-Boroujeni(1), Esfandiar Heidarian(2), Hamid Rouhi-Boroujeni(3), Minasadat Khoddami(4), Mojgan Gharipour(5), Mahmoud Rafieian-Kopaei(6)

Abstract

BACKGROUND: Hyperlipidemia is one of the important diseases in pregnancy that causes fetal abnormalities during pregnancy and after the birth. Unfortunately, the usual anti-fat drugs are associated with high morbidity in fetus and due to people's inclination towards taking herbs, it is required to identify side effects of medicinal herbs in pregnancy. The aim of this study was to present hypolipidemic herbs that would not any complications for mother and fetus.

METHODS: In this review article, the major electronic databases such as EBSCO, Central Register of Controlled Trials (CENTRAL), China Network Knowledge Infrastructure (CNKI), Cochrane, Google scholar, MEDLINE, SciVerse, Scopus, and Web of Science were searched using the key words “herbal” and “hyperlipidemia”, “herbal” and “pregnancy” matched by MeSH from their respective inceptions till September, 2016. Total of 1723 publications (145 review articles, 855 original research articles, and 723 abstracts) about the effect of herbals on hyperlipidemia and 682 publications (200 abstracts, 423 original research articles, and 59 review articles) about the effect of herbals in pregnancy were retrieved. At the end, a list of medicinal plants effective on hyperlipidemia alongside their effects on pregnancy was developed. Finally, the plants effective on hyperlipidemia and safe during pregnancy were determined and their dosage, complications, mechanism of action, and side effects were reported.

RESULTS: A total of 110 effective herbs on hyperlipidemia were identified and complications of 95 plants in pregnancy were studied. At last, among the 55 selected plants effective on hyperlipidemia and examined for pregnancy, we reported 12 herbs with their dosage and special considerations that can be used to treat hyperlipidemia during pregnancy.

CONCLUSION: Some medicinal plants can be used to treat hyperlipidemia during pregnancy without any significant side effects both on mother or fetus.

Keywords: Hyperlipidemias, Pregnancy Outcome, Fertility, Dyslipidemia, Herbals, Medicinal Plants, Oxidative Stress

Introduction

Exposure to elevated levels of cholesterol and oxidative stress due to products of cholesterol metabolism during fetal period has been shown to result in programmed death of fetal arterial cells with a predisposition to atherosclerosis later in life.1 Commonly, during reproductive years (about 2 decades), risk of cardiovascular diseases reduces. Besides, lipid and lipoproteins is not been measured routinely during pregnancy as gestational dyslipidemia is considered physiologic with little clinical significance.2 However, recent discoveries of fatty streaks in the aorta of 6-month-old fetuses and also evidences of aortic atherosclerosis in autopsy of deceased infants with normal levels of cholesterol born to mothers with

Currently, no reference standards exist for lipid parameters during pregnancy, although it is well-known that pregnancy is a state of insulin resistance, which is reflected by lipoprotein lipid profiles. Pregnancy-related hypertriglyceridemia is rare, but it can be life threatening in some patients with genetic susceptibility. Complications can include acute pancreatitis, hyperviscosity syndrome, and potentially preeclampsia. Overweight and obese women are significantly more likely to exceed the pregnancy-related weight gain recommendations. Women with gestational diabetes and/or preeclampsia are also at increased risk for elevated triglyceride levels, development of chronic hypertension, recurrent gestational diabetes and/or overt diabetes, recurrent preeclampsia, and development of albuminuria later in life. These side effects of statins and other antihyperlipidemic drugs in animal models of pregnancy showed delayed delivery, increased postimplantation loss, decreased litter size and pup birth weight, 40% pup survival rate, 4% neonate survival, no pup survival to weaning, and increased incidence of spina bifida, abortion, and fetal skeletal abnormalities (domed head, hunched shoulders, rounded body, abnormal chest, kyphosis, stunted fetuses, altered skeletal formation of ribs, sternbrae, vertebrae, and palate). Delayed delivery, decreased live births, and death of 17% of fetuses occurred at doses 18 times higher than the maximum human dosage. In addition, studies on animal reproductive system with doses 7 to 10 times higher than the recommended human dosage based on body surface area (BSA) have demonstrated to have embryocidal and teratogenic effects.

Lifestyle changes and glycemic control should be instituted if necessary. During pregnancy, a bile acid sequestrant can safely treat elevated cholesterol levels. Women must be educated about dietetic measures and body mass reduction even in preconception period. In addition, during pregnancy, mothers must be monitored and due to risk of pancreatitis in case of triglyceride above 11.5 mmol/l, other therapy options must be taken into account. In the last trimester of pregnancy, severe hypertriglyceridemia associated with pancreatitis can be treated with omega-3 fatty acids, parenteral nutrition, plasmapheresis, and other lipid-lowering agents.

The use of herbal medicines has been increasing in many developing and industrialized countries. More and more pregnant women are using herbal remedies to treat pregnancy-related problems due to cost-effectiveness of therapy and easy access to these products. To date, over 200 plants have been recommended for treatment of hyperlipidemia. As with chemical drugs, medicinal plants can cause permanent damage to fetus. Therefore, despite people’s willingness to use medicinal plants, certain precautions with these plants should be taken into account. In addition, couples are likely to use these plants on the verge of fertility to treat hyperlipidemia or other disorders. Therefore, it is highly necessary for both physicians and patients to know which plants have optimal effects on hyperlipidemia during and before pregnancy without having side effects. The aim of this review article was to investigate the effect of plants on hyperlipidemia and plant-based side effects in pregnancy and fertility as well as to introduce the plants that are effective on hyperlipidemia during pregnancy.

### Materials and Methods

In this study, 2405 publications (204 review articles, 1278 original full text articles, and 923 abstracts) were retrieved. The major electronic databases including Web of Science, Scopus, PubMed, Google scholar, MEDLINE, EBSCO, China Network Knowledge Infrastructure (CNKI), and Cochrane Central Register of Controlled Trials (CENTRAL) were searched from their respective inceptions till September 2016. To identify herbs used to treat hyperlipidemia the following keywords were used and matched by the MeSH: “herbal in hyperlipidemia”, “botany in hyperlipidemia”, “herbal therapy in hypertriglyceridemia”, “systematic review of herbal in hypercholesterolemia”, “herbal medicine for hypercholesterolemia”, “herbal with anti-lipid effect”, “natural remedies for hyperlipidemia”, “herbal therapy for atherosclerosis and “hypolipidemic diet”.

**Medicinal herbs and lipid-lowering in pregnancy**

---

136 ARYA Atheroscler 2017; Volume 13; Issue 3

www.mui.ac.ir 15 May
Total of 1723 publications (145 review articles, 855 original research articles, and 723 abstracts) were analyzed and their findings are registered in checklist 1.

We selected herbal drugs based on safety in pregnancy. All steps for searching and data extraction was based on the Cochrane protocol and checklist for systematic review (Figure 1).

In addition, to find evidence on the efficacy of herbs in pregnancy, fertility and infertility, 692 publications (200 abstracts, 423 original research articles, and 59 review articles) were analyzed. The headings that were used included “herbal in pregnancy”, “phytomedicine in pregnancy”, “side effects of herbal in pregnancy”, “herbals in pregnancy and lactation”, “herbal therapy in fertility”, “herbal therapy in infertility”, “herbal in infertility”, “phytomedicine in infertility”, “botany in pregnancy”, “medicinal plants in fertility”, “Chinese herbal in pregnancy”, “review of herbal in pregnancy”, and “Ayurvedic herbal in pregnancy”. The results of this investigation were registered in checklist 2. A plant was included in the analysis if its name appeared in at least two publications. Then, the plants effective on hyperlipidemia, fertility, and pregnancy were determined after the two checklists were integrated (Table 1). Finally, the plants effectiveness on hyperlipidemia and safety during pregnancy were determined and after analysis of 110 publications, their dosage, complications, mechanisms of action, and side effects were reported (Table 2).

**Results**

A total of 110 plants have been reported to be effective on hyperlipidemia and 95 plants were reported to be effective on fertility and pregnancy. Overall, 12 and 55 plants have been reported to be effective on lipid and safe during pregnancy, respectively. The potential side effects, dosage, and special considerations regarding these plants are shown in table 2. Moreover, 21 plants could be used in normal diet during pregnancy but were not recommended as medicinal plants.

**Discussion**

Hyperlipidemia can affect maternal and fetal health. Many side effects of chemical drugs on mother and fetus have led to prevention of their use during pregnancy. In this study, we found that the effective medicinal plants on hyperlipidemia contributed greatly to reducing oxidative stress via their antioxidant properties in addition to directly exerting hypolipidemic effects.

Reactive oxygen species cause damage to the structure of different cells and tissues including heart and vessels. Napoli et al. demonstrated that low levels of superoxide dismutase (SOD) in pregnant rabbits that had hyperlipidemia for over six months led to formation of fatty streaks in the aortic arch in their fetus.11

</thead>
<tbody>
<tr>
<td>Onion**</td>
<td>50 g of fresh onions or 5 g of dried drug</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages; The intake of large quantities can lead to stomach complaints</td>
<td>Popular; pressed juice and onion syrup, made of 500 g onions, 500 g water, 100 g honey and 350 g sugar</td>
</tr>
<tr>
<td>Garlic**</td>
<td>300 mg dry powder or 2 g fresh garlic</td>
<td>Abdominal discomfort, nausea, vomiting, diarrhea and a feeling of fullness have occurred with garlic therapy</td>
<td>Fresh garlic is not recommended in pregnancy</td>
</tr>
<tr>
<td>Lemon</td>
<td>1 g dry powder infuse</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages</td>
<td>Avoid the use of commercial liquid products because additional ingredients or fake lemon</td>
</tr>
<tr>
<td>Cranberry</td>
<td>10 ripe fruit twice a day after meal, 10 ml cranberry juice twice daily after meal</td>
<td>Mild stomach upset and diarrhea</td>
<td></td>
</tr>
<tr>
<td>Fig**</td>
<td>5 fruit twice daily</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages</td>
<td>It is better to be soaked in water</td>
</tr>
<tr>
<td>Apple**</td>
<td>3 fruit/day</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages</td>
<td>Apple seeds are highly toxic, avoid taking it</td>
</tr>
<tr>
<td>Psyllium**</td>
<td>1 g in 100 ml water twice daily</td>
<td>Allergic reactions ranging from sneezing to chest congestion and wheezing were reported in three nurses after psyllium use</td>
<td>The dose should be taken 30 min to one hour after taking other medications</td>
</tr>
<tr>
<td>Cherry**</td>
<td>2-5 g dry powder, 10-15 fresh fruit</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages</td>
<td>Storage: pomegranate should be sealed in containers and protected from moisture</td>
</tr>
<tr>
<td>Pomegranate</td>
<td>10 ml of juice twice a day or 20 g pomegranate seeds twice a day or 1 tablet/day (90 mg ellagic acid)</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages</td>
<td>-</td>
</tr>
<tr>
<td>Tomato**</td>
<td>Three tomatoes a day, or 1 g dry powder three times/day</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages</td>
<td></td>
</tr>
<tr>
<td>Grape**</td>
<td>10 g fresh fruit, 1 g dry powder</td>
<td>No health hazards or side effects are known in conjunction with the proper administration of designated therapeutic dosages</td>
<td></td>
</tr>
<tr>
<td>Ginger**</td>
<td>1 g dry powder/day</td>
<td>Increases appetite</td>
<td>Not recommended more than 1 g/day</td>
</tr>

Besides, Rumbold et al.\textsuperscript{59} and Mistry et al.\textsuperscript{60} investigated the role of antioxidants in reducing oxidation of fatty acids and decrease in fatty streaks in fetal heart. Clinical trials have demonstrated that oxidative stress due to hyperlipidemia during pregnancy causes circulatory disorders in fetus, delayed fetal development, and increased eclampsia.

Moreover, Jenkins et al. reported that there was significant association between decrease in SOD and increase in miscarriage in pregnant women with hyperlipidemia.\textsuperscript{41} According to the evidence, the antioxidant properties of the plants are due to polyphenols, flavonoids, flavonols, gallic acid, and anthocyanins that cause decrease in malondialdehyde (MDA) and increase in SOD, catalase, and glutathione peroxidase (GPX).\textsuperscript{42}

Some of the potent antioxidants that not only improve hyperlipidemia in pregnant women but also play a role in protecting the cardiovascular system of the fetus and the mother are as follows: allyl propyl disulphide, sterol, saponin, and quercetin in onion, allicin, allyl di- and trisulphide, alliin, aiones, vinylthiins in garlic, cyanidin, malvidin, peonidin, pelargonidin, petunidin and bioflavonoids in cranberry, bioflavonoids, polyphenols and triterpenoids, quercetin, catechin, phospholid and chlorogenic acid in apple, anthocyanin (cyanidin-3-rutinoside) and phenolic compounds (flavonol p-coumaroylquinic acid) in cherry, punicalagins, ellagic acid, unici acid, phytoestrogens, and anthocyanins in pomegranate, vitamins A, B, and E and lycopene in tomato, anthocyanin, vitamins A and E, polyphenols, oligostibenes, and ampelopsins in red grapes and zingiberene, curcumen, bisabolene, gingerols, and zerumbone in ginger.\textsuperscript{43}

\section*{Conclusion}

There are effective plants that can play a fundamental role in cardiovascular health in mother and fetus by reducing hyperlipidemia.
